

How to make “You met me at...” style videos

VOLUME 3 OF 3

Editing

Extract the music, sync his mouth to your voice, then cut, caption and export in CapCut. From the raw clip to a video you can post.

CapCut · Music extraction · Sync Lipsync 3 · Captions · End card · Export · Measure

START HERE

From raw clip to posted video

Vol. 1
Character creation
Persona, look, PS2 style, sets, voice.

Vol. 2
Video generation
Script, timing, Wan 3.0 settings, prompts.

Vol. 3
Editing
Music, lip sync, captions, end card, export.

You have the raw clip from Volume 2 (20 s, 4:3, 480p, with background music) and the voice track from Volume 1. Four moves turn them into the final video.

01
Extract
Pull the background music out of the clip in CapCut.

02
Lip sync
Sync his mouth to your voice in Sume.

03
Edit
Voice, music, captions and end card in CapCut.

04
Export
Vertical, loud enough, then measure.

The finished video: synced voice, music underneath, captions

STEP 1 · MUSIC

Extract the background sound in CapCut

The clip from Wan comes with music. Keep it: it was generated for this exact video and fits its rhythm.

1. **Import the raw clip**
   New project in CapCut, drop the raw clip on the timeline.

2. **Extract the audio**
   Use CapCut's extract audio option on the clip. You get the soundtrack as its own audio track.

3. **Keep only the music**
   If the model added voices or noises, use CapCut's vocal isolation or noise reduction to keep the background only. Menu names change between CapCut versions: look in the audio panel of the selected track.

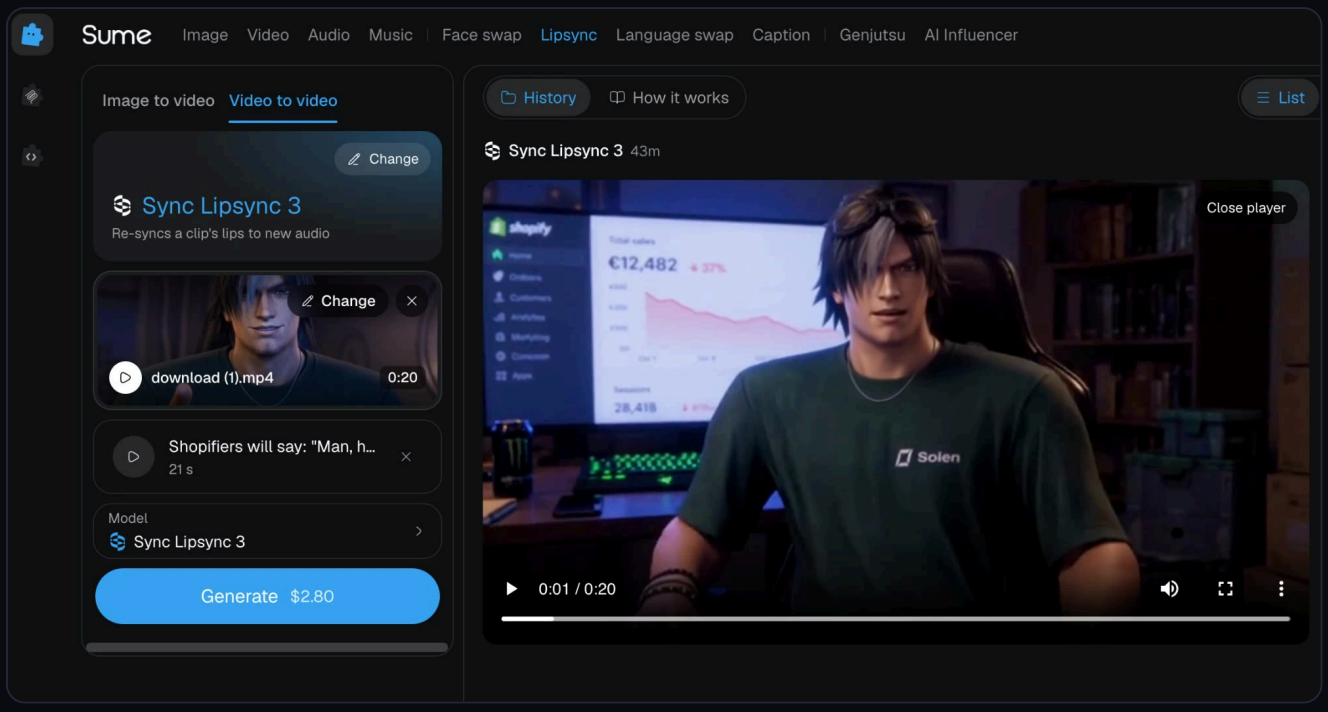

4. **Export the music**
   Export it as an audio file, or keep the project open: you will put the lip synced video back on top.

> Prefer a different sound? You can use any track you have the right to use, or a trending sound inside TikTok or Instagram when you post.

STEP 2 · LIP SYNC

Put your voice in his mouth

In Sume, open **Lipsync**, tab **Video to video**, model **Sync Lipsync 3** (re-syncs a clip's lips to new audio).

Sume · Lipsync · Video to video. Clip of 20 s, voice of 21 s, price shown $2.80.

1. **Upload the raw clip and the voice track**

   Lengths should be close. A voice longer than the clip gets cut at the end.

2. **Generate and watch it on mute, then with sound**

   On mute you see whether the mouth moves naturally. With sound you check each word lands. Wide shots and shots from behind will not sync: that is fine, the voice plays over them.

STEP 3 · TIMELINE

Build the edit in CapCut

Back in CapCut, set up three layers.

TRACK	CONTENT	RULE
Video	The lip synced clip	Its audio is your voice: keep it as the main sound
Music	The background you extracted, or your sound	Well under the voice: every word must be clear on a phone speaker
Text	Captions, then the end card	Added in steps 4 and 5

Cutting

- Cut only in the silences between sentences.
- Trim dead air at the start: the first word lands in the first second.
- Keep the full punchline, then go straight to the end card.
- Aim for 20 seconds in total, end card included.

0 s: the first word is already there

The punchline, then the end card

STEP 4 · CAPTIONS

Subtitles people can read with no sound

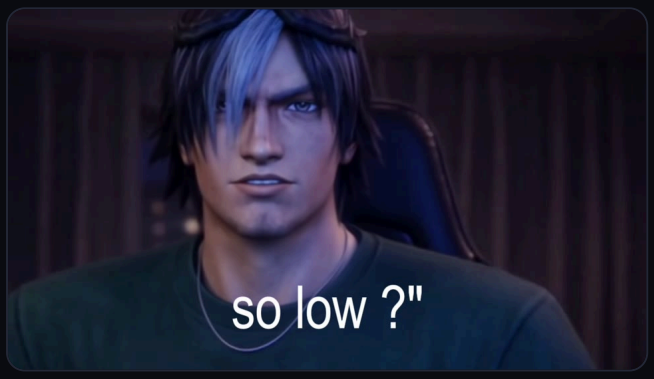

Many people watch muted. Captions carry the joke when the sound is off.

Style

- CapCut auto captions in English.
- 2 to 5 words on screen at a time.
- Big white text, black outline or shadow.
- Lower third, centered, clear of the face.

Proofread every line

- Auto captions invent words. Compare them with your script.
- In English, no space before "?" or "!".
- Keep quotation marks on the quoted question.
- Your URL spelled the way people type it.

To fix: "so low ?" should be "so low?"

To fix: the script said "Haha, like I don't know, bro"

STEP 5 · END CARD

Close on one clear action

The last 3 to 4 seconds. The CTA line of your voice plays over it.

Logo, one benefit, the URL in a button

Rules

- Your logo and name.
- One benefit in 4 words or less: "Get your free audit".
- The URL, big, in a high contrast box.
- The same aspect ratio as the rest of the video, or you get black bars.
- Nothing else on screen.

Make it in 4:3 and in 9:16

Design the card once in each ratio: 4:3 (768 × 576) to match the generated clip, 9:16 (1080 × 1920) for the vertical export. A simple dark background with your brand color is enough.

STEP 6 · EXPORT

Vertical, sharp enough, loud enough

SETTING	VALUE	WHY
Canvas	9:16, 1080 × 1920	TikTok, Reels and Shorts fill the screen with it
4:3 clip	Full width in the middle, blurred copy behind	No black bars, the image stays big
Captions	Inside the middle area	Clear of the app buttons at the bottom and the right
Loudness	About -14 LUFS	Our first export was near -30 LUFS, much quieter than the videos around it
Length	About 20 s	Short enough to watch twice

> **Check on a phone before posting:** watch it once muted (captions alone must carry the joke) and once with sound on the speaker (every word clear above the music).

Upscale?

The clip is 480p on purposе: the soft look is part of the style. Export at 1080 × 1920 anyway so the captions and the end card stay sharp.

STEP 7 · MEASURE

Know if it works before you make ten more

Post, wait 48 hours, write down four numbers from the platform analytics. Compare them with your own average post.

METRIC	QUESTION IT ANSWERS
3 second hold rate	Does the first frame stop the scroll?
Completion rate	Does the script hold attention to the end card?
Profile visits	Did the character make people curious?
Clicks or keyword comments	Did anyone act on the CTA?

Change one thing per video

Same character and room, new script: you learn which message works. Same script, new first shot: you learn what stops the scroll.

Cost of one finished video, at the prices shown when we made it

Wan 3.0 · 20 s · 4:3 · 480p	$1.00
Sync Lipsync 3 · 20 s clip	$2.80
Voice and images	Check the Generate buttons in Sume

Prices change. Retries add up: follow the checklists to need fewer of them.

BEFORE YOU POST

The final checklist

Sound

- [ ] Background music extracted, or a sound you have the right to use
- [ ] Voice clear above the music on a phone speaker
- [ ] About -14 LUFS

Lip sync

- [ ] Mouth matches every word on face shots
- [ ] No word cut at the end of the clip

Edit

- [ ] Cuts only in silences
- [ ] First word in the first second
- [ ] Every caption proofread against the script
- [ ] End card 3 to 4 s, same ratio

Export and after

- [ ] 9:16, 1080 × 1920
- [ ] Watched muted and with sound on a phone
- [ ] 48 h later: hold, completion, profile visits, clicks
- [ ] One change picked for the next video

The whole recipe in one breath

Persona, 3 identifiers, PS2 vocabulary, sets, voice. Script on 5 beats, shots on the silences, Wan 3.0 at 20 s, 4:3, 480p. Extract the music, sync the mouth, cut, caption, end card, export vertical, measure, change one thing.
